Grime's Graves is a large Neolithic flint mining complex in Norfolk, England. It lies 8 km (5.0 mi) north east from Brandon, Suffolk in the East of England. It was worked between c. 2600 and c. 2300 BC, although production may have continued well into the Bronze and Iron Ages (and later) owing to the low cost of flint compared with metals. Flint was much in demand for making polished stone axes in the Neolithic period. Much later, when flint had been replaced by metal tools, flint nodules were in Chapter I Introduction Previous excavations at Grimes Graves, as well as surface collection from the mined area, have resulted in the accumulation of an enormous quantity of flint material, now dispersed throughout England and beyond in museums and private collections. Both because there was a tendency to retain only selected specimens, and because details of provenance are not precise, these flints cannot now be used for any quantitative analysis, though their qualitative potential is still considerable.
