A fascinating photo-essay focuses on sundews, carnivorous plants that catch insects on their shining dewdrops, showing how these plants reproduce, where they grow, and how their tiny tentacles. With its flashy, very well taken photos, and simple text, this book is ideal for younger growers of carnivorous plants just becoming interested. It does not provide a lot of cultural information, but the pictures are fabulous! Gr. 4^-6. The subject's a grabber--literally--plants that fulfill their nutritional requirements by capturing and devouring insects. Wexler begins with a general introduction to carnivorous or insectivorous plants and then focuses on sundews, beautiful plants whose dewy, sticky leaves are excellent insect catchers. As with all of Wexler's books, the color photographs are a high point. Strikingly composed and intricately detailed, the pictures are both elegant and informative. The timed photographic series showing how a bit of egg white on a leaf is consumed over 20 hours is especially interesting.
